THOUSAND CANKERS DISEASE of black walnut is caused by the walnut twig beetle and a fungus it carries to trees. The walnut twig beetle is tiny — about the size of the “I” on a dime — and thousands of them could be hiding in the bark of a single piece of walnut firewood.

EMERALD ASH BORER — the infamous killer of ash trees — is found in forests and city trees across much of the eastern and central United States. This insect is notoriously good at hitching rides in infested firewood. Don’t give this tree-killing bug a ride to a new forest, or a new state!

OAK WILT is a deadly disease of oak trees, especially red oaks. This disease is a fungus spread between trees by small beetles — and this deadly fungus could easily be brought to your neighborhood or favorite camping spot through infected firewood.

GYPSY MOTH is a devastating pest of oaks and other trees. Female moths lay tan patches of eggs on firewood, campers, vehicles, patio furniture — anything outside! When these items are moved to new areas, this pest gets a free ride.

SPOTTED LANTERNFLY sucks sap from dozens of tree and plant species. This pest loves tree-of-heaven but will feed on black walnut, white oak, sycamore, and grape. Like the gypsy moth, this pest lays clusters of eggs on just about any dry surface, from landscaping stone to firewood!

ASIAN LONGHORNED BEETLE will tunnel through, and destroy, over 20 species of trees — especially maple trees. The larvae of this beetle bore into tree branches and trunks, making it an easy pest to accidentally transport in firewood.

You have the power to protect forests and trees! Pests like the invasive emerald ash borer can hitchhike in your firewood. You can prevent the spread of these damaging insects and diseases by following these firewood tips:

- Buy locally harvested firewood at or near your destination.
- Buy certified heat-treated firewood ahead of time, if available.
- Gather firewood on site when permitted.

FIREWOOD ALERT!

What might be in your firewood?
