"Tonight's tale of terror? The ***INVASIVE SPECIES*** that hitched a ride!"

Howdy, Campers,

Did you know that the forests you love are in danger? All because of invasive insects and diseases that hitch a ride on firewood. Spooky, right?

Tried-and-true solutions

To prevent the spread of any invasive species that might be lurking in your logs:

1. Buy certified, heat-treated firewood.

Certified wood comes with a government stamp or seal that proves it's safe to move long distances. Since it's been treated, you don't have to worry about invasive species hitching a ride.

2. Collect or purchase firewood at your destination.

Firewood should never be moved more than 10 miles from where it was originally cut — unless it's been heat-treated!

Follow these tips to keep the forests safe from ***the horrors of infestation***.

DON'T MOVE FIREWOOD
